

ABSTRACT

Solid composition has an organic spill absorbing material in which is absorbed certain of a liquid organic compound or composition. The organic spill absorbing material can be water insoluble, particulate polymer particles that imbibe liquid organic materials. A halogenated organic can provide the liquid organic compound or composition. The halogenated organic can be a halogenated hydrocarbon. A fire can be fought by transmitting the solid composition containing a suitable flame retardant to the base of the fire under conditions such that the absorbed liquid in liquid or vapor form is released; and a living target can be stupefied by transmitting the solid composition containing a suitable stupefying agent under conditions such that vapors of the stupefying agent are released and stupefy the target.
